Statement of Purpose

Anoushkrit Goel

My journey into AI began with two pivotal courses: one by **Prof. Madan Gopal** and another by **Prof. Andrew Ng** which sparked fascination and broke myths about AI. I started my career as a **Data Scientist** in 2019, deliberately choosing this role over other offers. Shortly after, I founded **Tensr.AI**, focused on early triaging of cardiovascular diseases using AI and novel wearable device. This experience taught me how to lead teams, secure funding, and brainstorming and pitching ideas.

After closing my startup chapter, I returned to the industry, where I broadened my expertise across various domains and datasets. The advent of large language models and the guidance of **Dr. Shailesh Kumar** inspired me to dive deeper into the field. This led me to pursue a Master's in Intelligent Systems at IIT Mandi, where I achieved a **CGPA** of **9.47/10**. During this time, I directed my energy toward healthcare AI, taking up a **DST**-funded project to analyze brain connectomes. Our work is set to be deployed at **PGI Chandigarh Hospital** (lab of **Dr. Chirag Ahuja, Neuroradiologist**) and has already resulted in a published paper, *TractoEmbed* (**ICPR** 2024), and another submission, *TractoGPT* to **ISBI** 2025.

Research, in general, played a pivotal role in reigniting my interest for building things and solving problems which don't have a direct solution and need innovative thinking

With this opportunity, I see a future working with great minds which will provide distilled and fresh perspective to building great products. For me, this opportunity is a step toward mastering the art of creating efficient, innovative AI models while contributing to groundbreaking research.

Wit**h 6 years of deep learning experience** spanning **medical imaging, 3D point clouds, text, and signal data**, I bring a multidisciplinary skill set to the table. My time in both startups and academia has taught me how to approach challenges creatively, deliver results in constrained settings, and navigate open-ended problems. This blend of technical expertise and entrepreneurial thinking positions me to contribute meaningfully to DeepMind's mission of advancing AI.

In the short term, I aim to develop highly efficient deep learning models and contribute to publications in top-tier conferences and journals. Long-term, I envision creating AI systems that redefine healthcare, making diagnosis and treatment more accessible and effective. DeepMind's commitment to interdisciplinary problem-solving deeply resonates with me, and I am particularly excited by the prospect of collaborating with researchers like Vivek Natarajan, Alan Karthikesalingam, Shwetak Patel, and Khaled Saab. On maybe projects like **AMIE**, **MedGemini**, or even more ambitious projects like AlphaFold, or maybe general projects like Gato.

With my skillset I plan incorporate **3D Neuroimaging** ability in AMIE to enhance its multi-modal capabilities or even give models the ability to **prognosticate**. I am certain that I will contribute immensely in other AI research projects as well.
